CONGRATULATIONS!

With your purchase of a FISHER instrument you have completed a chain of events that began many months ago, in our research laboratories. For it is there that the basic concept of the equipment you have just acquired came into being—its appearance, its functions, its quality of performance, its convenience of use.

But the end step—your purchase—is merely a beginning. A door has now opened, for you and your family, on virtually unlimited years of musical enjoyment. Recognizing that one of the keys to pleasurable ownership is reliability, we have designed this instrument to give long and trouble-free service. In fact, instruments we made over twenty-seven years ago are still in use today.

Remember always that we want this equipment to give you the best performance of which it is capable. Should you at any time need our assistance toward that objective, please write me personally.

AN IMPORTANT SUGGESTION

Many hours have been spent by our engineers and technical writers to create this instruction book for your guidance and enjoyment. If you want the most out of your FISHER, there is only one way to obtain it. With the equipment before you, please read this booklet carefully. It will be time well spent!

Avery Fisher
Founder and President

FISHER FIRSTS—Milestones in the History of High Fidelity Reproduction.

1937 First high-fidelity sound systems featuring a beam-power amplifier, inverse feedback, acoustic speaker compartments (inactive baffle and bass reflex) and magnetic cartridges.
1937 First exclusively high fidelity TRF tuner, featuring broad-tuning 20,000 cycle fidelity.
1937 First two-unit high fidelity system with separate speaker enclosure.
1938 First coaxial speaker system.
1938 First high fidelity tuner with amplified AVC.
1939 First 3-Way Speaker in a high fidelity system.
1939 First Center of Channel Tuning indicator.
1943 First Preamp/Equalizer with selective phonograph equalization.
1944 First Range Expander with feedback.
1949 First FM-AFN Tuner with variable AFC.
1952 First 50-Watt, all triode amplifier.
1952 First self-powered Master Audio Control.
1953 First Universal Horn-Type Speaker Enclosure for any room location and any speaker.
1953 First AFM-AM Receiver with a Cascade Front End.
1954 First low-cost electronic Mixer-Fader.
1954 First moderately-priced, professional FM Tuner with 2000s.
1955 First Peak Power Indicator in high fidelity.
1955 First Master Audio Control Chassis with five-position mixing facilities.
1955 First correctly equalized, direct tape-head master audio controls and self-powered preamplifier.
1956 First to use Power Monitor in a home amplifier.
1956 First All-Transistorized Preamp/Equalizer.
1956 First dual dynamic limiters in an FM tuner for home use.
1956 First Performance Monitor in a high quality amplifier for home use.
1956 First FM-AFN Tuner with two meters.
1956 First complete graphic response curve indicator for bass and treble.
1957 First Golden Cascade FM Tuner.
1957 First MicroPry Tuning Indicator.
1958 First Stereophonic Radio-Phonograph with Magnetic Stereo Cartridge.
1959 First High-quality Stereo Remote Control System.
1959 First complete Stereophonic FM AFN Receiver (FM-AFN Tuner, audio control, 40-watt amplifier).
1959 First high-compliance plus high-efficiency free-piston speaker system.
1960 First to use Microfoil for FM tuning and as a Recording Audio Level Indicator.
1960 First complete stereo FM-AFN receiver with 60-watt power amplifier and new 7591 output tubes.
1960 First reverberation device, for use in high fidelity equipment—The Fisher Dynamic Spacespander.
1960 First stereo tuner with MicroTune.
1960 First FM tuner with six IF stages.
1960 First FM tuner with five limiters.
1960 First front panel antenna selector switch, 32-3000 channel, illuminated, last position.
1961 First Multiplex units with STEREO BEACON and automatic switching, mono to stereo.
1961 First complete receivers with Multiplex.
1961 First FM-Stereo-Multiplex Tuners with STEREO BEAM.
1961 First loudspeaker system with treble woofer cone, eliminating all parasitic resonances.
1961 First internal switching system to permit immediate tape playback with use of all controls and switches.
1962 First simplified-operation Control-Amplifier, with infrequently used controls behind a front-panel cover, yet immediately accessible.
1962 First loudspeaker with eddy-current-damped voice coil.
1962 First bass speaker with combined sinter-silicon and fiber cone.
1962 First FM Tuner Kit with separate d'Arsenal meter for tuning and separate cathode ray stereo broadcast indicator (STEREO BEAM).
1962 First Stereophonic FM Tuner with TUNE-O-MATIC Motor Tuning.
1962 First Supersonic Wireless Remote Control in a high fidelity component.
1963 First to use 8417 tubes with unique cavity-anode design.
1963 First power amplifier to use oscilloscope-type, frequency compensated input circuit.
1963 First amplifier kit with STRATABALANCE, visual dynamic balancing system.
1964 First multiplex adapter with 'flywheel synchronization' closely approaches theoretical limit of noise reduction, and of all spurious responses.
1964 First AFC with strong locking on weak signals, with no pull-in from adjacent strong signals.

© 1964 FISHER RADIO CORPORATION PRINTED IN U.S.A.
YOUR NEW FISHER 800-C is the result of an extensive development project by the Fisher Laboratories. The design objective was to create a single electronic unit combining a professional quality AM-FM-Multiplex tuner, a Master Audio Control of the highest flexibility and performance, and a high-power, dual-channel audio amplifier of the calibre normally found only in elaborate studio installations. This design objective has been achieved in every respect. The tuner section of the 800-C, for example, achieves the remarkable IHFM Usable Sensitivity rating of 1.8 microvolts, making it the most sensitive receiver ever produced. This is achieved through the use of the new GOLDEN SYNCHRODE front-end, followed by four wideband IF stages and a ratio detector with a one-megacycle bandwidth. Three short-time-constant limiters provide maximum suppression of unwanted noise. The multiplex decoder is the superior time-division type utilizing two balanced diode bridges and a 38-kc synchronous oscillator acting together as electronic switches. This circuit reduces noise and distortion to the theoretical minimum and provides the highest possible separation. The famous STEREO BEACON* light and automatic switching feature makes manual switching between stereo and monophonic programs unnecessary. The AM tuner of the 800-C features a powerful pentode RF amplifier, pentagrid converter and an IF amplifier with variable bandwidth. A highly sensitive, individually tuned ferrite rod AM antenna is included with your 800-C.

The audio control center of the 800-C incorporates a full range of operating features, comparable to professional installations. Separate, friction-lock Bass and Treble controls for each channel, full tape recorder facilities including the FISHER DIRECT TAPE MONITOR* system, High and Low sharp cut-off filters and a front-panel earphone jack are provided. In addition, a new 4-position Speaker Selector switch is included, permitting the 800-C to act as the control center for remote speaker installations as well as the main set of speakers. The dual-channel power amplifier achieves an IHFM Music Power rating of 75 watts, enough to drive any speakers to full room volume.

The most important ingredients of any FISHER component, however, are not so obvious. They are the careful design, the craftsmanship in construction and the rigid test procedures behind every FISHER unit that receives the final stamp of approval. Before leaving the factory, your 800-C had to pass an extensive series of stringent examinations. In this way we constantly endeavor to protect our long-standing, world-wide reputation for the very highest standards in performance, reliability and durability. By purchasing the best, you have assured yourself of many years of pleasurable and trouble-free music listening.

CUSTOM MOUNTING INSTRUCTIONS  10
FOR THE 'MAN IN A HURRY'  11
TECHNICAL SPECIFICATIONS  16

WHAT IS STEREOPHONIC SOUND?

Stereo (stereo) is a method of reproducing sound by means of two independent channels, left and right, so that a spatial feeling of direction and depth is recreated. It is the extension of high fidelity sound into three dimensions. In fact, it offers the closest approach to true high fidelity yet achieved because it comes closest to the ultimate aim of all high fidelity systems—a perfect recreation of the original live sounds. Thus, good stereophonic sound is high fidelity in the truest sense of the term.

This feeling of dimension is lost with monophonic (single channel) reproduction, because our ears help determine the relative position of separate instruments in an ensemble only if each hears a slightly different version of the sound, just as visual depth perception depends on the two separate, slightly different pictures received by the eyes. Merely using two or more speakers on a single amplifier does not solve the problem; it only spreads the single sound source without providing the all-important different “aural viewpoints.”

True stereo sound, then, requires the use of two independent sound paths from the origin to your ears, kept separate at all times during recording, transmission and reception. This requires the use of two separate sets of recording amplifiers, a means of keeping the channels apart during recording and radio broadcasting, and finally, two independent amplifier and speaker systems in the home. In a stereo record, each wall of the groove contains a separate signal, and the stereo cartridge is designed to pick up each of these two channels separately. The new system of FM stereo broadcasting (known as “multiplex”) utilizes a separate ultrasonic signal, in addition to the main signal. By combining these two signals in a multiplex decoder, the original left and right channels are recovered. Stereo tape recordings are made by impressing the two channels on separate parallel tracks running along the length of the tape.

No attempt is made to keep the two channels completely separate. In a live performance, your left ear hears many of the sounds on your right, and vice versa. Thus, keeping the channels totally apart from the original recording session to the final playback in your home would result in an unnatural effect. But enough separation is maintained so that a definite feeling of direction occurs as you listen to the reproduced sound. The result is a remarkably vivid illusion of great depth and spaciousness, such as is normally obtained only at a live performance.

INSTALLING THE 800-C

The Fisher 800-C operates on 105-120 volts, 50-60 cps (AC) only, and consumes 235 watts at full power output. Connecting the unit to other voltages or direct current (DC) may cause serious damage to
the unit, and voids the warranty. Two auxiliary power outlets, which are controlled by the power switch on the Volume control, are provided on the rear panel for the connection of other components.

The 800-C may be placed on a shelf, or installed in a custom cabinet or console of your choice. Should you desire a wood cabinet, the FISHER Model 30-U component cabinet, especially designed for the 800-C, is available, in walnut finish, from your dealer. If you decide to mount the 800-C in a custom installation, please refer to the Custom Mounting Instructions section before proceeding with the installation, since certain precautions must be observed during installation. For open-shelf installation with or without the 30-U cabinet, leave a minimum of two inches of space on both sides of the unit, and five inches of space above the tops of the output tubes (V10, V11, V13, V14) for ventilation. Avoid placing the unit on soft or yielding material, since this could impede ventilation through the underside of the chassis.

Loudspeakers

Placement of loudspeakers has a significant effect on the sound quality of a high fidelity system. Most speakers will give better results in the bass range when placed in a corner, although there are exceptions to this rule. Speakers should generally be placed along a wall in such a position that no large objects block the sound path between the speakers and the listening area. In a stereo system the speakers should be approximately equidistant from the listening area. As a rough rule of thumb, the distance between the speakers should be approximately two-thirds the distance separating the speakers from the listening area. It has been found that the aural effect of stereophonic sound is enhanced when two identical speaker systems are used. Although these principles can serve as a general starting point in placing your loudspeakers, we strongly recommend that you experiment with several different arrangements before deciding on a final placement. The unpredictable effects resulting from furniture arrangement and irregularities in room dimensions may sometimes make unorthodox placement of the loudspeakers necessary.

After the initial location of the loudspeakers has been decided upon, make the following connections:

ONE SPEAKER: If you are using only one speaker, connect it to the SPKR-1 terminal and its adjacent COM terminal on the L terminal strip under SPEAKER OUTPUT (Figure 1). For distances of up to 50 feet, use ordinary power cord; for longer distances, use heavy-duty wire. The L (left) IMPEDANCE SELECTOR is used to match the output impedance of the 800-C to the impedance of your loudspeaker. The upper wire protruding from the rear panel next to the IMPEDANCE SELECTOR should be connected to the terminal marked “4,” “8,” or “16,” depending on the impedance of your loudspeaker. Be sure to turn the Balance control fully counterclockwise before turning on your 800-C. The Balance control should be kept in the maximum counterclockwise position until a speaker is attached to the R speaker output terminals.

TWO SPEAKERS: For two-speaker stereo, connect the left-channel speaker to the L (left) SPKR-1 terminal and its adjacent COM terminal; then connect the right-channel speaker to the R (right) SPKR-1 terminal and its adjacent COM terminal. Make sure that each COM terminal is connected to the common (C or COM) terminal of its corresponding speaker. This will assure correct phasing of the speakers, causing them to “push” and “pull” in unison, rather than in opposition. Use ordinary power cord for distances up to 50 feet, heavy-duty power cord for longer distances. The wires protruding from the rear panel should be connected to the terminal on the IMPEDANCE SELECTOR which corresponds to the impedance of your loudspeaker. The upper wire and IMPEDANCE SELECTOR strip is for the left speaker system, the lower terminal strip and wire is for the right speaker system.

THREE SPEAKERS: If you wish to connect a center channel speaker for either three-channel stereo or remote monaural, connect a third speaker directly to the CENTER SPKR terminals on the rear of the 800-C. An additional power amplifier is not required. In order to assure
USE EITHER PHONO LOW OR PHONO HIGH INPUTS. DO NOT CONNECT TO BOTH INPUTS AT THE SAME TIME.

FIGURE 1. Tube layout and rear panel of the 800-C.
correct phasing of your speakers, be sure to connect the ground or common terminal, (designated G, GND, C, COM, etc.) of your loudspeaker to the upper terminal. The center speaker, preferably of 16-ohm impedance, may also have an impedance of 4-to 8 ohms. For the 4-ohm speaker, a 15-ohm, 10-watt series resistor or a 16-ohm L-pad should be used. An 8-ohm speaker requires a 10-ohm, 5-watt resistor or a 16-ohm L-pad. If necessary, the volume of the center speaker may be further reduced by the addition of more series resistors (10-ohm, 5-watt, 20-ohm, 10-watt).

Since most users of stereo equipment use the third channel loudspeaker as a monaural extension speaker, special provision has been made for this speaker to operate in all positions of the Speaker Selector switch (even the EARPHONES position). If you desire to use the third speaker in a three-channel stereo arrangement, provision must be made to disable the third speaker when the Speaker Selector switch is in the EARPHONES position. This may be accomplished by placing a single-pole, single-throw switch (such as an appliance switch used on line cords) in one of the third speaker's leads.

**ADDITIONAL EXTENSION SPEAKERS:** For mono and stereo listening in other rooms of your home, you can connect extra pairs of speakers. Connect the left speaker in each pair to the L SPKR-2 terminal and its adjacent COM terminal, and the right speaker to the R SPKR-2 terminal and its adjacent COM terminal. Make sure that each COM terminal is connected to the common terminal of its corresponding speaker. The total impedance of the extension speakers used in each channel should be the same as that of the main speaker in that channel.

**Antennas**

The 800-C is supplied with a built-in ferrite loop antenna for AM reception. This antenna provides superior rejection of noise and static and should prove more than adequate for all but extreme long-distance applications. The antenna should be rotated to the rear and downward to prevent interference from the metal chassis and transformers. The forward position is used for shipping only. Since this type of antenna is somewhat directional, the 800-C chassis should be rotated, if possible, to determine the orientation which provides the best reception. For long-distance reception, connect 10 to 20 feet of flexible, single-conductor wire to the right-hand AM antenna terminal (Figure 2); don't use the GND terminal. Run the wire in a straight line along a non-metallic baseboard, under a rug, or draped out a window.

For FM reception, a folded dipole antenna is included with the 800-C. The two arms of this antenna should be horizontal and away from all large metal objects and electrical wiring for best results. After the antenna has been connected and the 800-C put into operation, the dipole antenna should be rotated horizontally to determine the orientation for best reception. In apartment buildings and other buildings using steel structural supports, reception can generally be improved by placing the antenna close to a window. If tacks or staples are used to fasten the antenna in place, be sure that they do not contact the conductors running along the edges of the antenna wire. Also, avoid mounting the antenna **directly** on a wall; fasten the antenna to strips of wood, then mount the strips on the wall. In a strong signal area, the antenna may be placed under a carpet, but as a general rule, the higher the antenna is placed, the better your FM reception will be. Never fold or coil the antenna while it is connected to the receiver.

FM multiplex reception requires stronger signals to achieve the same low noise levels as you are used to from ordinary monophonic programs. You may find, therefore, that placement of the antenna may have to be improved for good multiplex reception. In some cases, especially in fringe areas, an outdoor rooftop antenna or even a highly directional yagi type may be needed for multiplex reception, even though the indoor antenna suffices for monophonic transmissions. A directional antenna is also very effective in preventing multipath distortion, caused by the simultaneous reception of the direct signal from the FM station and one or more reflected and delayed signals, bounced off of the buildings or other large vertical surfaces.

**CONNECTIONS:** For good reception under most conditions, connect the FM dipole antenna or an external 300-ohm FM antenna to the NORM terminals on the terminal strip marked ANTENNA CONNECTIONS. If you find, after putting the 800-C in operation, that several
strong local stations appear at several places along the band, change
the connections to the LOC terminals. The LOC terminals attenuate
the input signal, thus preventing overload distortion and lowering the
over-all sensitivity of the receiver. Therefore, if you wish to receive
some weak stations, use the NORM terminals for best results.

**Record Players and Changers**

Record players or changers using magnetic or ceramic phonograph
cartridges can be played through the 890-C. The PHONO LOW input
jacks are used for all types of magnetic cartridges, and the PHONO
HIGH inputs are designed for ceramic cartridges with adaptors for
magnetic inputs. If you cannot ascertain which of the two leads from
the record player is the channel A (Left) output and which is the
Channel B (Right) output, connect them to the 890-C and listen for
normal placement of the instruments on a symphonic stereo record. If
the violin section appears to be located on the right, reverse the leads
from the phonograph. (Special test records may also be obtained from
your record dealer.)

**NOTE:** If you hear only weak and distorted sound, the two channels
from your phono cartridge may be connected out-of-phase. To correct
this condition, simply reverse the two leads from one channel of the
cartridge.

**Tape Recorders**

Tape recorders can be connected to play through and to record from
the 890-C. If the recorder has separate record and playback heads, the
DIRECT TAPE MONITOR system will permit you to listen to your
tapes while they are being recorded, and to have the full use of all the
audio control facilities of the 890-C during ordinary playback of pre-
viously recorded tapes. Connections are as follows:

**STEREOPHONIC TAPE RECORDER:**

1 – Connect the Channel A or Left **high-level** input of the tape recorder
to the Left Channel RCRDR OUT jack on the receiver.

2 – Connect the Channel B or Right **high-level** input of the tape re-

3 – Connect the Channel A or Left **high-level** input of the tape recorder
to the Left Channel RCRDR OUT jack on the receiver.

4 – Connect the Channel B or Right **high-level** input of the tape re-

**MONOPHONIC TAPE RECORDER:**

1 – Connect the **high-level** input of the tape recorder to the Left
Channel RCRDR OUT jack on the rear panel of the receiver.

![Diagram of antenna connections](link-to-diagram)

**FIGURE 2.** Antenna connections.
2 — Connect the output of the tape recorder to both the Left and Right Channel TAPE MON jacks. You can obtain a "Y" connector from your dealer for this connection. This connection to both TAPE MON jacks is necessary for tape playback and monitoring through both speaker systems.

**Tape Decks**

A tape deck is the tape transport mechanism without the electronic preamplifier found in tape recorders. Such tape decks may be played through the 800-C by connecting the Channel A (or Left) output on the tape deck to the jack on the 800-C marked Left Channel TAPE HEAD. The Channel B (or Right) output of the tape recorder should be connected to the Right Channel TAPE HEAD jack on the 800-C. A monophonic tape deck should be connected to both TAPE HEAD jacks by using a "Y" connector, available from your dealer.

**DYNAMIC SPACEXPANDER®**

The FISHER Model K-10 DYNAMIC SPACEXPANDER® is a unique reverberation device that recreates the acoustical environment of a concert hall in your home. To install the SPACEXPANDER, remove the jumper wires from the TO REVERB jacks on the top of the 800-C's chassis but keep them for re-use in case you disconnect the SPACEXPANDER. (Either these jumpers or the SPACEXPANDER must be connected or the 800-C will be silenced.) Make the following connections:

1. **LEFT TO REVERB OUT** jack on the 800-C to the channel A OUTPUT jack on the SPACEXPANDER.
2. **RIGHT TO REVERB OUT** jack on the 800-C to the channel B OR C OUTPUT jack on the SPACEXPANDER.
3. **LEFT TO REVERB IN** jack on the 800-C to one of the channel A INPUTS on the SPACEXPANDER.
4. **RIGHT TO REVERB IN** jack on the 800-C to one of the channel B INPUTS on the SPACEXPANDER.

**System Grounding**

Either of the two sheet-metal screws at the bottom of the chassis rear panel may be used to ground the motor and tone arm of your record player, to reduce the possibility of hum. The chassis grounds of other components may also be connected to the 800-C in this manner, if desired. Do not use the SPEAKER OUTPUT COM terminals.

**TV Sound**

Because television receivers differ widely in circuit design, it is advisable to consult your serviceman before attempting to connect the sound output of your TV set to the 800-C. However, once the method of connection has been determined, the cable from the TV set should be connected to both AUX input jacks. The sound portion of the TV program will be heard when the Selector is turned to the AUX-TAPE position.

**CAUTION:** If the TV set is an AC/DC or "transformerless" type, have a serviceman take precautions to prevent shock hazard and hum.

**OPERATING THE 800-C**

Your 800-C is now ready for operation, but like any other fine piece of electronic equipment, it must be operated correctly in order to deliver its full capabilities. We urge you to read these instructions carefully in order to achieve optimum results.

**NOTE:** See the dress-panel illustration on page 11 for rapid identification of the controls and switches described in Paragraphs 1—11.

1. **Volume Control**

   The Volume control regulates the total volume of sound from both speakers. The AC Power switch is combined with this control and turns off the power to the 800-C (and all other equipment connected to the auxiliary power outlets on the rear panel) at the extreme counterclockwise position. The Volume control changes the sound level from both channels equally, thus making it unnecessary to balance the channels each time you change the volume.

2. **Selector Switch**

   The Selector switch determines which program source will be heard and at the same time selects the mono or stereo mode of operation.
The positions perform the following functions:

**TAPE HEAD**: Selects a tape deck connected to the TAPE HEAD jacks and provides correct equalization for tapes played at a speed of 7½ inches per second. When playing tapes at 3¾ inches per second, advance the treble control to the "three o'clock" position for correct equalization.

**PHONO MONO**: This position is used to listen to monophonic records on a record player or changer connected to the PHONO LOW or PHONO HIGH jacks on the rear panel. The two stereo channels of the record player are electrically connected, resulting in a more accurate reproduction of monophonic records and a great reduction in possible record noise caused by vertical motion of the stylus.

**PHONO STEREO**: This position should be used for all stereophonic records on a player or changer connected to the PHONO LOW or HIGH jacks.

**FM AUTOMATIC**: This position is normally used for all FM broadcasts, both monophonic and stereo. The STEREO BEACON (to the left of the tuning scale on the dial glass) will light when a stereo program is being transmitted and the set will automatically switch into the stereo mode. At the conclusion of the stereo broadcast, the STEREO BEACON will turn off and the set will automatically switch back to the monophonic mode.

**FM STEREO FILTER**: This position is used when listening to a stereo FM program from a weak or distant station. When the noise level on an FM stereo program is too high for enjoyable listening, using the FM STEREO FILTER position will decrease the noise considerably, without appreciably altering the tonal characteristics of the program. With the Selector in this position, the STEREO BEACON indicates and the 800-C remains in the stereo mode even during a monophonic broadcast. For this reason, remember to turn the Selector back to FM AUTOMATIC at the conclusion of the program.

**FM MONO**: This position is designed to provide monophonic reception of stereo FM programs so weak that they cannot be received satisfactorily in either the FM AUTOMATIC or the FM STEREO FILTER positions. Because monophonic FM reception is inherently quieter than FM stereo, the noise level on a stereo program will be greatly reduced when the FM MONO position is used. For monophonic reception of monophonic programs, use the FM AUTOMATIC position.

**AM**: This position is used for listening to programs on the standard broadcast band, 550 to 1650 kc.

**AUX-TAPE**: This position selects either a component connected to the AUX input jacks or a tape recorder connected to the TAPE MONO jacks.

---

### FM and AM Tuning

The Tuning knob selects both FM stations in the 88 to 108 megacycle band and AM stations in the 550 to 1650 kilocycle band. When tuning in the stations of your choice, set the dial pointer at the position which results in a maximum indication on the Tuning Meter. When tuning across the FM band, with the Selector at FM AUTOMATIC, the STEREO BEACON will signal whenever you reach a station broadcasting in stereo. For your added convenience, a logging scale with linear divisions from 0 to 100 is included between the two bands. By making a note of the location of your favorite stations on this linear scale, you will be able to tune to them more quickly and accurately.

### Speaker Selector Switch

The Speaker Selector switch is designed for maximum convenience when using more than one pair of speaker systems, or when using earphones with your 800-C. The four positions are as follows:

**SPEAKER—1**: This position is used to listen to the speakers connected to the SPKR-1 terminals on the rear panel. If you have only one set of speakers (no additional remote speakers connected to the 800-C), use this position except when listening through earphones.

**SPEAKER—2**: This position selects the speakers connected to the SPKR-2 terminals on the rear panel. The SPEAKER-2 position permits you to listen to such speakers, while silencing the main speakers connected to the SPKR-1 terminals.
NOTE: If you do not have any remote speakers, and therefore have not made any connections to the SPKR-2 terminals, do not use this position.

SPEAKER 1 + 2: This position is used to listen to both your main speakers (connected to the SPKR-1 terminals) and your additional remotely located speakers (connected to the SPKR-2 terminals) at the same time. Do not use this position unless you have remote speakers installed.

EARPHONES: This position is used for personal listening with earphones. All speakers are silenced, thus permitting you to listen to the 800-C (with stereo earphones plugged into the EARPHONES jack) without disturbing others. Be sure to return the switch to one of the other positions when disconnecting the earphones.

Earphones

The Earphones jack is conveniently located at the center of the front panel. It will accept any standard stereo earphones plug. When using your earphones for the first time, turn the Volume control to minimum before connecting them and then turn up the volume slowly (with the Speaker Selector at the EARPHONES position) until you reach the volume level you prefer. Then switch the Speaker Selector to the SPEAKER-1 position and compare the sound level from the speakers. This test will enable you to set the correct volume level for the earphones before plugging them in, thus avoiding possible damage caused by overloading them.

CAUTION: To protect the earphones against overload and damage, do not leave them plugged in when playing the speakers at high volume levels.

Loudness Contour Switch

The Loudness Contour switch is used to add compensation for the natural deficiency of the human ear in the extreme bass and treble ranges at low volumes. With this switch in the ON position, an increasing emphasis of low bass and high treble tones is added as the Volume control is turned counterclockwise, resulting in a more natural sound at low volumes.

Balance Control

This control is used to equalize the sound levels from both speaker systems to achieve the optimum stereo effect. If the left and right inputs are exactly balanced, you will hear equal sound levels from the left and right speakers with the control in the NORMAL position. If, however, there is an imbalance in the program levels, you can rebalance the sound levels by turning the Balance control either clockwise (to increase the sound level on the right and decrease the sound level on the left) or counterclockwise (to increase the left and decrease the right). The Balance control is not a volume control since the same over-all volume is maintained as it is adjusted. With the Balance control fully counterclockwise, only the left speaker will be heard; with the control fully clockwise, only the right speaker will be in operation.

Bass and Treble Controls

The Bass controls increase or decrease the amount of bass tones heard in the sound output. With the Bass controls in the NORMAL position, the bass tones will sound exactly as they were recorded at the program source. If you wish to increase the bass emphasis because of a bass deficiency in the record, tape or radio broadcast you have selected, simply turn the Bass controls clockwise. To decrease the prominence of the bass tones, turn the Bass controls counterclockwise. Normally, the Bass controls for left and right speaker systems rotate together, but if you wish to adjust the Bass separately for each channel, hold one of the knobs while turning the other.

The Treble controls adjust the intensity of the Treble tone heard in the sound output. As with the Bass controls, the NORMAL position will result in the same degree of treble tone as exists in the program source. The relative amount of treble tone can be increased, resulting in a more brilliant and crisp sound, by turning the Treble control clockwise; and it can be decreased, resulting in a more mellow and intimate tone, by turning the control counterclockwise. The Treble controls may also be adjusted individually for each channel by holding one knob while rotating the other.
The center knob of each dual control adjusts the left channel; the outside ring adjusts the right channel. Excessive use of bass boost when playing records may result in acoustic feedback (a low rumbling sound), caused by the close proximity of your speakers and record player.

9 High and Low Filters

The High Filter is a sharp cut-off circuit designed to remove annoying record scratch, hiss and other high frequency noise without dulling the treble portion of the musical program. It may also be used to eliminate noise on multiplex programs from very weak stations. The Low Filter is similarly designed to remove low frequency noise without weakening bass tones in the musical signal. Note that the High Filter is effective on tape playback but does not affect the recording.

10 AM Bandwidth Switch

Strong local AM stations can be received with maximum fidelity by placing this switch in the BROAD position. On weaker signals, however, interference from adjacent stations may be experienced with the switch in the BROAD position, and noise may be increased. In this case, place the AM Bandwidth switch in the SHARP position to increase the selectivity of the AM tuner and thereby reduce noise and interference to much lower levels.

11 Tape Monitor Switch

This switch is used only while making a recording. At all other times it should be left in the OFF position. While the recording is being made, you can compare the quality of the tape with the original sound source by sliding the switch back and forth between ON (to hear the tape itself) and OFF (to hear the original sound source). The tape recording will not be affected by the operation of this switch or by the setting of the other controls (except the Selector switch and the Low Filter). For playback of a previously recorded tape, use the AUX-TAPE position on the Selector switch.

CUSTOM MOUNTING

The 800-C Receiver may be mounted in a special component cabinet, Model 30-U, or it may be mounted in your own custom cabinet by following the directions and illustrations in this section. It is important to remember that adequate ventilation is absolutely essential for proper operation of the 800-C. The enclosure should therefore be open at the rear. Never install the chassis above other heat-producing equipment.

The 800-C is shipped with four plastic mounting feet attached to the bottom of the chassis. To install the 800-C in a custom cabinet, these mounting feet must first be removed.

HORIZONTAL MOUNTING

Installation With Cleats

To provide adequate ventilation to the underside of the chassis, it is advisable to mount the 800-C on wooden cleats which are fastened to the floor of the cabinet. For this installation, proceed as follows:

1 - Obtain a strip of wood $\frac{3}{4}$ inch square and 26 inches long. Cut this strip in half to form two 13-inch cleats.

2 - Fasten the two cleats to the top of the mounting board with wood screws in the position shown in Figure 3. Screw heads should be flush with the top of the cleats. Then locate and drill four $\frac{3}{4}$-inch holes through the mounting board and cleats as indicated.

3 - Saw a cutout through the front panel of your cabinet to the dimensions shown in Figure 4. The distance between the top surface of the mounting board and the bottom of the cutout must be the same as the height of the cleats.

4 - Make sure that the plastic feet have been removed from the 800-C. Before installing the unit, obtain four 1$\frac{1}{4}$-inch 8-32 machine screws with washers and check a sample screw to make sure that it does not protrude more than $\frac{1}{4}$ inch above the cleats; use the washers if necessary. Slide the 800-C into the front-panel cutout until its control panel is tight against the cabinet front panel and hides the rough edges of the cutout. Fasten the receiver into place with the screws.
FOR THE 'MAN IN A HURRY'

STEP 1
Turn on power by turning VOLUME control slightly clockwise until it clicks. Adjust later for desired volume.

STEP 2
Set SELECTOR to the program source you wish to hear.
PHONO MONO or PHONO STEREO to listen to a monophonic or stereo record.
FM AUTOMATIC for an FM broadcast.
AM for an AM broadcast.
AUX-TAPE for a tape recording.

NOTE: Set all other switches and controls in the position shown.

BASS AND TREBLE CONTROLS:
To adjust the Left Channel use the inner knob; To adjust the Right Channel use the outer knob.
FIGURE 3. Top view of custom installation.
Flush Installation

If the height of the custom cabinet will not permit you to mount the 800-C by means of cleats, as described in the preceding section, the chassis may be mounted directly on the cabinet shelf. If the chassis is mounted in this way, however, it is essential that cutouts be made in the shelf as shown in Figure 3, and that the back of the cabinet remain completely open, in order to provide proper ventilation. For a flush-mounted installation, proceed as follows:

1.—Locate and drill the four 5/16-inch holes in the bottom shelf of the custom cabinet as indicated in Figure 3.

2.—Saw cutouts in the bottom shelf following the outlines shown in Figure 3. It is absolutely essential that these cutouts be made as indicated so that the necessary ventilation will be supplied to the 800-C chassis.

3.—Saw a rectangular cutout through the front panel of your custom cabinet to the dimensions shown in Figure 4. Note that the bottom of the cutout coincides with the top of the mounting shelf, since cleats are not used in this installation.

4.—Make sure that the plastic feet and their retaining screws have been removed from the 800-C. Depending on the thickness of the mounting shelf, use either these screws or four 1-inch 8-32 machine screws with washers for fastening the 800-C into place. Before installing the unit, check a sample screw to make sure that it does not protrude more than 1/4 inch above the shelf; use the washers if necessary. Slide the 800-C into the front-panel cutout until its control panel is tight against the cabinet front panel and hides the rough edges of the cutout. Fasten the receiver into place with the screws.

VERTICAL MOUNTING

In order to mount your 800-C vertically, the cabinet must have an open back, and the compartment in which the receiver is mounted must be sealed off from all other heat-producing equipment. In addition, you will need a fan capable of delivering a minimum of 25 cubic feet per minute. Follow the mounting procedure outlined below.

1—Determine the position in which you wish to mount the receiver. After checking beneath the top panel of the cabinet for any obstruction, make a cutout in the top panel, as shown in Figure 4.

2.—Cut the mounting board shown in Figure 5 from a piece of 3/4-inch plywood. The width of the mounting board should be 1/4 inch less than the inside width of the cabinet, to allow for the clearance of 1/8 inch as shown in Figure 5. Make the cutouts (indicated as shaded areas) in Figure 5.

3.—Cut two cleats approximately 12 inches long (cleats 1 and 2) from a piece of 3/4 by 3/4-inch stock.

4.—Cut two cleats approximately 16 inches long (cleats 3 and 4) from a piece of 1 by 1-inch stock.

5.—Drill a 5/16-inch hole two inches from one end of cleats 1 and 2 (holes A and B). Drill a second 5/16-inch hole (holes C and D) spaced 8 inches from the first hole on each cleat.

6.—Drill 3/16-inch pilot holes in cleats 3 and 4, for the screws shown in Figure 5.

7.—Mount cleats 3 and 4 on the inside of the cabinet, as shown in Figure 5. Drill 1/16-inch pilot holes in the cabinet for each screw, about 1/4 inch deep.

8.—Mount the fan in place, as shown in Figure 5. The axis of the fan should be pointed towards the spot on the mounting board marked 'X'. The fan must be no more than 4 inches away from the mounting board.

9.—Remove the plastic feet, control knobs, hex nuts and dress panel from the 800-C. Fasten the unit and cleats 1 and 2 to the mounting board with four 1/4-inch 8-32 machine screws and four flat washers.

10.—Secure the mounting board to cleats 3 and 4 as shown, using #8 1-1/4-inch round-head wood screws.

11.—Plug the fan into one of the receptacles on the rear of the 800-C. If the fan has a switch, it should be left permanently in the ON position. Replace the dress panel, hex nuts and control knobs.

NOTE: The fan must be connected in such a manner as to always be on whenever the receiver is on. For this reason, only the receptacle on the rear of the 800-C should be used to furnish power to the fan. The fan must blow the air towards the chassis.
FIGURE 4. Front panel cutout.
IF YOU HAVE ANY QUESTIONS REGARDING VERTICAL MOUNTING OF THE 800-C, WRITE OR CALL OUR CUSTOMER RELATIONS DEPARTMENT BEFORE PROCEEDING WITH THE INSTALLATION

FIGURE 5. Side view of custom cabinet installation (vertical mounting)
## TECHNICAL SPECIFICATIONS

### THE FM TUNER:
- **IHF M Usable Sensitivity**: 1.8 microvolts
- **Signal-to-noise-and-hum ratio (100% modulation)**: 70 dB
- **Selectivity (alternate channel)**: 60 dB
- **IF Rejection (at 100 Mc)**: 90 dB
- **Sporious Response Rejection (at 100 Mc)**: 90 dB
- **Image Rejection (at 100 Mc)**: 65 dB
- **Capture Ratio**: 2.5 dB
- **FM Harmonic Distortion (400 cps, 100% mod.)**: 0.5%
- **Calibration Accuracy**: 0.2%
- **FM Stereo Channel Separation (at 1 kc)**: 35 dB

### IM DISTORTION (60/7000 cps, 4:1)
- Each channel (at 33 watts): 0.7%

### FREQUENCY RESPONSE
- **Over-all**: 25-25,000 cps ± 1.5 dB
- **Power amplifier section**: 5-45,000 cps ± 0, −2 dB

### HUM AND NOISE
- **(High Level Input, below rated output)**: 80 dB
- **Channel Separation (at 1 kc)**: 50 dB
- **Bass Controls (total variation at 50 cps)**: 23 db
- **Treble Controls (total variation at 10 kc)**: 23 db
- **Low Filter (−3 db at 60 cps)**: 12 db per octave below 50 cps
- **High Filter (−3 db at 5 kc)**: 12 db per octave above 6 kc

### INPUT SENSITIVITY (for rated output)
- **PHONO**: 3.3 mV
- **TAPE HEAD**: 2.5 mV
- **AUX**: 230 mV
- **MONITOR**: 450 mV

### POWER LINE REQUIREMENTS
- 105-120 volts, 50/60 cycles

### TOTAL POWER CONSUMPTION (at 117 volts)
- at one-third rated output: 205 W, 245 VA
- at rated power output: 235 W, 270 VA

*BECAUSE ITS PRODUCTS ARE SUBJECT TO CONTINUOUS IMPROVEMENT, FISHER RADIO CORPORATION RESERVES THE RIGHT TO MODIFY ANY DESIGN OR SPECIFICATION WITHOUT NOTICE AND WITHOUT INCURRING ANY OBLIGATION.*
WARRANTY TO OWNER

The warranty on a product reflects the confidence of its maker in the quality of materials and workmanship that go into it. The unique FISHER warranty protects your investment. Please read it carefully.

All FISHER equipment is fully guaranteed to the original using purchaser against defects in materials and workmanship, subject to the following terms.

WARRANTY FOR FACTORY-ASSEMBLED FISHER ELECTRONIC COMPONENTS, EXCEPT SPEAKER SYSTEMS. All parts (except tubes) are guaranteed for two years and any defective part will be repaired or replaced without charge. Tubes are guaranteed for one year. There is no charge for warranty labor during the first 90 days. Defective parts or equipment must be returned properly packed, transportation prepaid, to the FISHER dealer from whom it was originally purchased, or to a FISHER Authorized Service Center, or, after written authorization, to the FISHER plant. All warranty service is F.O.B. the dealer, service center, or FISHER plant.

WARRANTY FOR FISHER SPEAKER SYSTEMS. All Speaker Systems are guaranteed to the original purchaser against defects in material and workmanship for a period of five years from date of sale to the original purchaser. During this period, all defective parts, including cabinetry, grille cloth, nameplates, and other exposed material, will be repaired or replaced without charge. There is no charge for warranty labor during the five-year period.

The Speaker System must be returned in its original carton, or a factory-authorized substitute. If requested, the owner will be sent a factory-authorized carton immediately upon receipt of a check or money order for $2.00. This warranty is automatically void if a FISHER Speaker System is returned to the factory in any other container. To request a carton, write to PARTS Department, Fisher Radio Corporation, 11-40 45th Road, Long Island City, N. Y. All warranty service for Speaker Systems is F.O.B. the above address.

WARRANTY FOR FISHER STRATAKITS. Fisher StrataKits carry the same warranty as factory-wired components except that FISHER does not assume any responsibility for the proper performance of the kit resulting from errors on the part of the kit builder, or his failure to follow the procedure outlined in the construction manual. These warranties are void if our inspection shows that the equipment has been tampered with, or installed, altered or repaired at variance with factory-designated procedures, subjected to negligence, misuse or accident, damaged by excessive line voltage or insufficient ventilation, or had its serial number altered, defaced or removed.

This warranty is in lieu of all other warranties, express or implied, and all other obligations or liabilities on the part of FISHER. No person, including any dealer, agent or representative of FISHER, is authorized to assume any liability for FISHER except to refer purchasers to this warranty.

This warranty takes effect only if the warranty-registration card has been fully and properly filled out and returned to FISHER RADIO CORPORATION within ten (10) days from the date of purchase.

Register Your FISHER Equipment Now and Enjoy Exclusive Owner Privileges:
- Full benefits of the FISHER warranty.
- Prompt handling of correspondence with our Customer Service Department.
- Assistance in finding your equipment or establishing its value in case of loss through theft, fire, etc.
- News bulletins on important developments in high fidelity equipment.

THE MAN BEHIND THE PRODUCT

AVERY FISHER
Founder and President, Fisher Radio Corporation

Twenty-seven years ago, Avery Fisher introduced America's first high fidelity radio-phonograph. That instrument attained instant recognition, for it opened a new era in the faithful reproduction of records and broadcasts. Some of its features were so basic that they are used in all high fidelity equipment to this day. One of these models is now in the permanent collection of the Smithsonian Institution as an example of the earliest high fidelity instruments commercially available in this country.

The engineering achievements of Avery Fisher and the world-wide reputation of his products have been the subject of descriptive and biographical articles in Fortune, Time, Pageant, The New York Times, Life, Coronet, High Fidelity, Esquire, The Atlantic, and other publications. Benefit concerts for the National Symphony Orchestra in Washington and the Philadelphia Orchestra, demonstrating recording techniques, and the great advances in the art of music reproduction, used FISHER high fidelity instruments both for recording and playback, to the enthralled audiences. FISHER equipment formed the key part of the high fidelity demonstration at the American National Exposition in Moscow, July 1959. FISHER FM and FM-AM tuners are the most widely used by broadcast stations for monitoring and relay work, and by research organizations—under conditions where absolute reliability and maximum sensitivity are a 'must.'

The FISHER instrument you have just purchased was designed to give you many years of pride and enjoyment. If you should desire information or assistance on the installation or performance of your FISHER, please write directly to Avery Fisher, President, Fisher Radio Corporation, Long Island City 1, New York.
