TABLE

1. Dolby Mode Chart   16

FOREWORD

To obtain optimum performance and enjoyment from the Model 4300, please study these instructions carefully. Follow the step-by-step instructions to obtain maximum performance.

This manual is divided into two parts. The first covers installation and operation in simple, nontechnical language. The second describes the Model 4300 in more detail with technical specifications and functional explanations.

For quick identification of the controls and connections, references are printed in bold face type.

AFTER UNPACKING

It is advisable to save all original packing material to prevent damage should you wish to transport or ship the Receiver (refer to Figure 15 for packing instructions). Please inspect your Model 4300 carefully for any signs of damage in transit. It has undergone stringent quality control inspection and tests prior to packing, and left the factory in perfect operating condition. If the unit is damaged, notify the carrier without delay. Only the consignee may institute a claim with the carrier for damage during shipment. However, the Marantz Company will co-operate fully in such an event. Save the damaged carton as evidence for inspection by the carrier.

The FM multiplex circuitry includes a phase locked loop, Stereo-Monaural Automatic switching circuit, stereo indicator circuit and a buffer amplifier to obtain output power at low impedance. Low pass filters for 19KHz and 38KHz rejection are incorporated. Moreover, the Model 4300 unit has a muting circuit that permits pleasant FM broadcast reception by completely eliminating inter-station interference which is usually generated at the time of selecting FM stations.

GENERAL DESCRIPTION

Your Marantz Model 4300 is a high-quality Stereo 2 + Quadradial 4 Receiver developed by Marantz, a name famous for quality in the audio component industry. The Model 4300 incorporates Marantz' exclusive Vari-Matrix circuit which simulates 4-channel sound from normal 2-channel stereo programs, and is capable of reproducing 4-channel sound from any matrix-encoded source. The 4300 will also reproduce any discrete 4-channel program as well as regular stereo and monaural programs. An optional plug-in decoder adapts the 4300 for any specific matrix system, such as Columbia's SQ.

The FM tuner section employs an FET for the RF amp stage. The IF tuning circuit employs ceramic filters of wide bandwidth and high selectivity to provide high sensitivity and unparalleled interference-free operation.

The 4300 incorporates a full-process, 2-channel DOLBY System to reduce noise, inherent in recording music from records, tape, FM broadcasts and TV.
CONNECTING THE 4300

The 4300 can be used as a stereo or 4-channel Receiver. When using the 4300 as a stereo unit, the POWER MODE Switch on the rear panel should be placed in the 100W x 2 mode. The instructions contained in this manual are to be followed for both stereo or 4-channel operation; however, for stereo operation, the front channels alone will apply.

1. Using a balanced and shielded 300 Ohm cable, connect an FM antenna to the 4300 as shown in Figure 11.
2. Using No. 18, or heavier, lamp cord (zip cord), connect main speakers to the 4300 as follows:

<table>
<thead>
<tr>
<th>LEFT FRONT SPEAKER</th>
<th>4300</th>
<th>RIGHT REAR SPEAKER</th>
<th>4300</th>
</tr>
</thead>
<tbody>
<tr>

<td>to FRONT CD-4/AUX L</td>
<td></td>
</tr>
<tr>
<td>to PHONO R</td>
<td></td>
<td>to REAR CD-4/AUX L</td>
<td></td>
</tr>
</tbody>
</table>

4. If a discrete 4-channel playback device (Q-8 cartridge player, 4-channel reel-to-reel player, CD-4 discrete disc demodulator, etc.), is to be engaged in the system, make connections between the device and the 4300 using shielded audio cables with phono plugs.

- or GND or NEG or PHY ONO L
+ or HOT or POS or 1 to PHONO R

RECORD PLAYER

The 4300 can be used as a stereo or 4-channel Receiver. When using the 4300 as a stereo unit, the POWER MODE Switch on the rear panel should be placed in the 100W x 2 mode. The instructions contained in this manual are to be followed for both stereo or 4-channel operation; however, for stereo operation, the front channels alone will apply.

1. Using a balanced and shielded 300 Ohm cable, connect an FM antenna to the 4300 as shown in Figure 11.
2. Using No. 18, or heavier, lamp cord (zip cord), connect main speakers to the 4300 as follows:

<table>
<thead>
<tr>
<th>LEFT FRONT SPEAKER</th>
<th>4300</th>
<th>RIGHT REAR SPEAKER</th>
<th>4300</th>
</tr>
</thead>
<tbody>
<tr>
<td>- or GND or NEG or</td>

<td></td>
<td>+ or HOT or POS or 1</td>
<td></td>
</tr>
</tbody>
</table>

3. Using shielded audio cables with phono plugs, connect your record player to the 4300 as follows:

<table>
<thead>
<tr>
<th>LEFT OUTPUT</th>
<th>4300</th>
<th>DISCRETE 4-CHANNEL PLAYBACK DEVICE</th>
<th>4300</th>
</tr>
</thead>
<tbody>
<tr>
<td>to PHONO L</td>
<td></td>
<td>to FRONT CD-4/AUX L</td>
<td></td>
</tr>
<tr>
<td>to PHONO R</td>
<td></td>
<td>to REAR CD-4/AUX L</td>
<td></td>
</tr>
</tbody>
</table>

4. If a discrete 4-channel playback device (Q-8 cartridge player, 4-channel reel-to-reel player, CD-4 discrete disc demodulator, etc.), is to be engaged in the system, make connections between the device and the 4300 using shielded audio cables with phono plugs.

- or GND or NEG or PHY ONO L
+ or HOT or POS or 1 to PHONO R
5. Using shielded audio cables with phono plugs, connect a discrete 4-channel tape recorder to the 4300 as follows:

**DISCRETE 4-CHANNEL TAPE RECORDER**

**LEFT-FRONT OUTPUT**

or **LINE OUT**

to **FRONT TAPE MONITOR IN L**

**LEFT-REAR OUTPUT**

or **LINE OUT**

to **REAR TAPE MONITOR IN L**

**RIGHT-FRONT OUTPUT**

or **LINE OUT**

to **FRONT TAPE MONITOR IN R**

**RIGHT-REAR OUTPUT**

or **LINE OUT**

to **REAR TAPE MONITOR IN R**

**LEFT-FRONT INPUT**

or **LINE IN**

to **FRONT TAPE MONITOR OUT L**

**LEFT-REAR INPUT**

or **LINE IN**

to **REAR TAPE MONITOR OUT L**

**RIGHT-FRONT INPUT**

or **LINE IN**

to **FRONT TAPE MONITOR OUT R**

**RIGHT-REAR INPUT**

or **LINE IN**

to **REAR TAPE MONITOR OUT R**

6. Pull the AM ferrite-rod antenna out as shown in Figure 12.

7. Set the controls and switches as follows:

- **FRONT L-R BALANCE**: Mid position
- **REAR L-R BALANCE**: Mid position
- **FRONT-REAR BALANCE MODE**: VARI-MATRIX
- **DIMENSION**: Mid position
- **BASS and TREBLE Controls VOLUME**: Minimum (fully counterclockwise)
- **MAIN SPKR**: ON (in)
- **REMOTE SPKR**: OFF (out)
- **FM MUTING**: ON (in)
- **MONITOR (TAPE/SOURCE)**: SOURCE
- **LOW FILTER**: OFF (out)
- **HI FILTER**: OFF (out)
- **LOUDNESS**: OFF (out)
- **DOLBY**: OFF
- **400Hz TONE POWER**: OFF (out)

8. Plug the 4300 into the AC wall outlet.

9. Turn the POWER Switch ON.

10. Select the desired program source by setting the SELECTOR Switch to appropriate position.
11. If phono is selected, put on a stereo record. If FM is selected, tune to a stereo broadcast.

12. Increase the VOLUME control to a comfortable listening level.

Your complete 4-channel or stereo system is now operative, and you may experiment with the various controls to discover their effects.

The remainder of this manual explains how to use your system most effectively.

**SOURCE DEVICES**

**2-channel**
A stereo record player may be connected to the PHONO jacks.

High level 2-channel playback devices (tuner, tape player, record player with equalized high level output, etc.) may be connected to the FRONT TAPE MONITOR and CD-4/AUX INPUTS.

**4-channel**
Discrete 4-channel playback devices (Q-8 cartridge player, 4-channel reel-to-reel player, CD-4 discrete disc demodulator, etc.) may be connected to the CD-4/AUX, TAPE MONITOR 1 or TAPE MONITOR 2 input jacks.

**REMOTE SPEAKERS**

The 4300 can accommodate both main and remote speaker systems. A second group of four speakers may be set up in another room. Connect these four remote speakers to the REMOTE SPEAKERS terminals as you did the main speakers.

The MAIN and REMOTE SPKR Switches on the front panel now permit activation of MAIN and/or REMOTE groups of loudspeakers.

**NOTE:** Do not use 4-Ohm speakers if main and remote speakers are to be used simultaneously. Use 8- or 16-Ohm speakers only.
SPEAKER PHASING

To assure the best 4-channel or Stereo separation and frequency response, the following tests will verify that all four speakers are correctly phased.

1. After the speakers are connected to the 4300, place all four speakers in the center of the room.

2. Set MODE Switch at MONO. Play a record (or radio or tape) with strong bass tones, at a low volume level. Center the FRONT L-R and REAR L-R BALANCE controls. Set FRONT-REAR BALANCE control at extreme FRONT position.

3. Position the front (left and right) speakers about six inches apart, face-to-face. Listen, particularly to the apparent loudness of the bass tones.

4. Next, turn off all power, but do not disturb the volume, tone or balance settings. Reverse connections on the right-front speaker only. Turn on the power, and listen again. If the bass tones now seem louder than in (3), you have corrected the phasing between the front (left and right) speakers. If the bass tones now sound softer, then turn off all power and re-connect the right-front speaker as you first had it connected.

5. Now check phasing between the two left (front and rear) speakers. Set both FRONT L-R and REAR L-R BALANCE controls at extreme L position, and set FRONT-REAR BALANCE for equal loudness from the two speakers. Position the two speakers face-to-face, about six inches apart, and listen for bass as in (3).

6. Turn off power. Experimentally reverse connections only on the left-rear speaker. Use the connection which gives the "best" bass, as in (4).

7. Last, check phasing between the two rear (left and right) speakers. Center both FRONT and REAR BALANCE controls. Set FRONT-REAR BALANCE control at extreme REAR position. Position the two rear speakers face-to-face as before. Listen for bass.

8. Turn off power. Experimentally reverse connections only on the right-rear speaker. Listen again to determine the "best" bass method of connecting the right-rear speaker. All speakers will then be in phase, and you may use all controls normally.

9. Once having phased your four speakers, you need not repeat the procedure in the future if you now code the speaker connections and/or the speaker cables. Any method of coding is satisfactory, provided it enables you, in the future, to duplicate your now-correct hookup between speakers and amplifiers.

SPEAKER PLACEMENT

Experimentation will reveal the best speaker locations in your room. The placements are shown in Figure 4.
Figure 4. Speaker Placement
FRONT PANEL FEATURES

MODE SWITCH

MONO
When the MODE Switch is in the MONO position, all input signals are summed. Speakers are driven as shown in Figure 5. Use the MONO position for A) phasing speakers and B) playing a monaural source, such as TV audio, AM radio or monaural records through all four channels, C) setting up BALANCE controls.

2 CH
When the MODE Switch is in the 2 CH position, left-front and left-rear inputs are summed. Right-front and right-rear inputs are summed. Speakers are driven as shown in Figure 6. Use the 2 CH position for playing regular stereo records without synthesizing rear channels.

DISCRETE
When the MODE Switch is in the DISCRETE position, each input signal goes to its respective output channel. Speakers are driven as shown in Figure 7. Use the DISCRETE position for A) playing discrete 4-channel sources such as Q-8 cartridges or CD-4 records, and B) playing 2-channel stereo programs through front speakers only.

VARI-MATRIX
When the MODE Switch is in the VARI-MATRIX position, rear input signals are internally disconnected. Left-front and right-front inputs feed left-front and right-front speakers, as in the DISCRETE MODE. Rear channel signals are "synthesized" or derived from the left-front and right-front input signals. The characteristics of the rear channel signals are varied by the DIMENSION control. Speakers are driven as shown in Figure 8.
DIMENSION

The DIMENSION control is operative only when the MODE Switch is set to the VARI-MATRIX position. This control optimizes the 4-channel VARI-MATRIX effect.

SQ DECODER

With the MODE Switch on SQ DECODER, any rear input signals to the 4300 are internally disconnected. The rear channel outputs are, instead, derived from front channel signals which have been processed by the plug-in decoder. The characteristics of these derived rear channel outputs are determined by the type of plug-in decoder. Use SQ DECODER position only with an optional plug-in decoder installed. Without this optional decoder, there will be no output when the MODE Switch is on SQ DECODER.

BALANCE CONTROLS

The Model 4300 has three BALANCE Controls: FRONT L-R, REAR L-R and FRONT-REAR. The FRONT L-R slide knob adjusts the balance between the front channels. The REAR L-R slide knob adjusts the balance between the rear channels. The FRONT-REAR slide knob adjusts the balance between the rear and front pairs of channels. The balancing technique described must be carried out in MONOAURAL MODE. To balance the front channels, first set the FRONT-REAR control all the way to the FRONT to silence the rear speakers while you adjust the FRONT L-R BALANCE control. To balance the rear channels, move the FRONT-REAR control all the way to REAR, and then adjust REAR L-R BALANCE. Now you are ready to adjust the FRONT-REAR control for the most pleasing overall balance.

SELECTOR SWITCH

The SELECTOR Switch selects the program source for listening or recording. The switch can select any of six sources: AM, FM, PHONO, CD-4/AUX, TAPE 1 and TAPE 2.

BASS, MID AND TREBLE CONTROLS

These controls are used to adjust the tonal balance of program material to suit your individual listening preference. The bass, midrange and treble responses are adjusted by dual-concentric, friction-coupled controls. With the BASS, MID and TREBLE controls set at the center position, frequency response of the amplifier becomes flat.

The larger (outer) knob adjusts the response of the front audio channels, while the smaller (inner) knob adjusts the rear audio channels.

Turn the Tone Control knobs clockwise to boost or counterclockwise to attenuate their respective frequency ranges.

MONITOR SWITCH

When the MONITOR Switch is placed in the TAPE 1 or TAPE 2 position, the signals connected to the tape input jacks will be played back.

To play a tape recorder that is connected to the TAPE MONITOR 1 jacks, select TAPE 1 on the SELECTOR Switch. To monitor the tape on a three-head recorder during recording, place the MONITOR Switch in the TAPE 1 position. To play a tape recorder that is connected to the TAPE MONITOR 2 jacks, select TAPE 2 on the SELECTOR Switch. To monitor the tape on a three-head recorder during recording, place the
MONITOR Switch in the TAPE 2 position. During recording, the MODE Switch should be in DISCRETE, VARI-MATRIX or SQ DECODER positions. This applies the source signal, unchanged, directly to the tape outputs.

To record a discrete 4-channel source on a 2-channel recorder, put the MODE Switch in the 2 CH position. Leave the MONITOR Switch in the SOURCE position while recording. This will feed the sum of the left-front and left-rear inputs to the left-front TAPE MONITOR OUT jack, and the sum of the right-front and right-rear inputs to the right-front TAPE MONITOR OUT jack.

To record any type of source on a monaural recorder, put the MODE Switch in the MONO position. Leave the MONITOR Switch in the SOURCE position while recording.

MAIN AND REMOTE SPKR SWITCHES

These switches select the loudspeaker terminals to which audio power is fed. The MAIN and REMOTE groups of loudspeakers may be operated separately or simultaneously. With both speaker switches in the “out” position, all loudspeakers are disconnected. The signal at the FRONT and REAR PHONES jacks is not affected by the MAIN and REMOTE SPKR Switches.

NOTE: When using both MAIN and REMOTE speakers simultaneously, the combined impedance of all the speakers should not be less than 4 Ohms.

POWER SWITCH

This pushswitch turns the Power on or off. When the POWER Switch is “in”, the dial lamp illuminates. Be sure to turn the POWER pushswitch off before plugging or unplugging the power cord.

FRONT AND REAR PHONES JACKS

These jacks accept a standard 3-conductor phone plug employed with standard stereo or 4-channel headphones. When using 2-channel headphones, insert the plug into the FRONT PHONES jack.

When using 4-channel headphones, insert the front plug into the FRONT PHONES jack and the rear plug into the REAR PHONES jack. Either high- or low-impedance headphones may be used.

LOUDNESS SWITCH

When listening at low levels, set this switch “in”. The LOUDNESS Switch boosts bass and treble tones to compensate for the human ear’s lack of response to those frequencies at low volume levels.

LOW FILTER SWITCH

With the pushswitch set “in”, the LOW FILTER suppresses low frequency noise, such as turntable rumble or “boomy, exaggerated” bass. The use of this filter will also reduce desired low frequency sounds, as well as unwanted noise. In the “out” position, the LOW FILTER is switched out of the circuits.

HI FILTER SWITCH

With this pushswitch set “in”, the High Frequency Filter suppresses high frequency noise, such as “scratch” from worn phonograph records and tape “hiss”. The filter will also slightly reduce high frequencies in the program material. When the program does not have high frequency noise, the HI FILTER pushswitch should be “out”.

METERS

The Model 4300 is equipped with two meters, a SIGNAL-STRENGTH Meter and an FM TUNING Meter. The SIGNAL-STRENGTH Meter indicates the signal-strength of any AM or FM broadcast. The FM TUNING Meter operates on FM only and indicates correct station tuning. The SIGNAL-STRENGTH Meter acts as a Dolby Calibration Meter when the DOLBY Switch is in any position other than “OFF”.

TUNING

AM: For optimum AM reception, tune to the
desired station. Then, rock the TUNING knob slightly back and forth until the maximum reading is obtained on the SIGNAL-STRENGTH Meter. The FM TUNING Meter is not used for AM.

FM: Set the SELECTOR Switch to “FM” and tune to the desired station. Then, slowly rock the TUNING knob back and forth until the FM TUNING Meter points to the center scale position.

FM MUTING SWITCH

When tuning to FM broadcasts with the FM MUTING Switch in its “in” position, the muting circuit will eliminate inter-station noise. To prevent muting of very weak stations along with the noise, the muting function may be turned off by releasing the FM MUTING pushswitch to the “out” position.

VOLUME

This control regulates volume of all four channels simultaneously.

DOLBY SWITCH

This switch sets the Dolby noise-reduction circuit for record or playback and also switches the Meter Mode from SIGNAL-STRENGTH to DOLBY CAL LEVEL, or vice-versa. With the DOLBY Switch placed in “OFF” position, the Meter will be used as a SIGNAL-STRENGTH Meter; in all other positions, as a DOLBY LEVEL Meter.

DOLBY FM: This position is used for listening to Dolbyized FM broadcasts. The Dolby FM level has been pre-adjusted at the factory.

PLAY: This position is used to play back a Dolbyized source (except FM).

OFF: With this position, the Dolby circuit is by-passed and the input signals are directly applied to both TAPE MONITOR OUT jacks and amplifiers.

RECORD I: For making a Dolbyized recording from an in-coming “flat” (non-Dolbyized) signal. When the MONITOR Switch is set to the SOURCE position, the “flat” signal will be heard. When making a Dolby recording and utilizing a three-head tape recorder, full advantage of the 4300’s 4-process Dolby System can be appreciated. When the 4300’s MONITOR Switch is in the TAPE 1 or TAPE 2 position, the signal heard will be “flat”, i.e., it will be the sound produced after the record and playback Dolby process has been completed.

RECORD II: For making a “flat” (non-Dolbyized) recording from an in-coming Dolbyized signal. Regardless of the position of the MONITOR Switch, a “flat” signal will be heard. For further details on the use of the DOLBY Switch, refer to the “Dolby Mode Chart” on page 16.

RECORD LEVEL (L) (R)

These knobs control the record level of the signals to be recorded through the Dolby unit. Adjust the knobs so that the Level Meter pointers of the tape recorder do not exceed the OVU level.

PLAY CAL. (L) (R)

These knobs adjust the playback outputs from a tape deck to the proper Dolby level.

400Hz TONE SWITCH

This is used for calibration of the record input level of the tape deck. When the switch is depressed, the built-in oscillator operates and a sine wave signal output of 580mV will be applied to the four TAPE MONITOR OUT jacks.
REAR PANEL FEATURES

PHONO JACKS

These two jacks are intended for use with magnetic cartridges requiring a standard 47,000 Ohm resistive load. If a hum is heard when playing a record, try reversing the polarity of the turntable power plug. If this is ineffective, connect a separate ground wire from the turntable or record changer to the CHASSIS GROUND binding post of the 4300.

CD-4/AUX JACKS

These jacks are for connection of any 4-channel high level equipment source. Manufacturers may use different terminology for the four channels, and care should be exercised to avoid confusing the signal channel terminations. The following are examples of 4-channel nomenclature equivalents:

LEFT FRONT LF–LF–CHANNEL–1 TRACK 1
LEFT REAR LR–LB–CHANNEL–2 TRACK 2
RIGHT FRONT RF–RF–CHANNEL–3 TRACK 3
RIGHT REAR RR–RB–CHANNEL–4 TRACK 4

TAPE MONITOR IN AND TAPE MONITOR OUT JACKS

These jacks are for the connection of a 2-channel or 4-channel tape recorder. (Refer to “SOURCE DEVICES”, page 4.)

FM ANTENNA TERMINALS

Connect the FM antenna to these terminals. For best FM reception, Marantz recommends a Log Periodic antenna mounted on a good quality rotor system. For rural areas, it is recommended that a local dealer be consulted about antenna installation and lighting arrestor protection. A master antenna system is not recommended for use with your Model 4300, such systems are usually designed expressly for television reception and frequently suppress FM signals before distribution. In addition, master antenna system often severely limit quality FM reception. Outdoor antennas are prohibited or inconvenient; use a simple form of 300 Ohm TV “rabbit ear” antenna or the simple ribbon-type folded dipole antenna supplied with the 4300. Both are practical and will give satisfactory results in primary signal areas.

Your Model 4300 will accept either a 75 Ohm or 300 Ohm antenna. (See Figure 11.) The 300 Ohm antenna cable should be connected to the two terminals marked FM on the ANTENNA terminal. When using 75 Ohm coaxial antenna cable, connect its shield to the “G” terminal, and its inner or center conductor to either of the FM terminals.

AM ANTENNA TERMINAL

An external AM antenna can be connected to this terminal. The 4300 is equipped with a ferrite-rod antenna for AM reception and it will give satisfactory results in primary signal areas.

Figure 11. FM/AM Antenna Connections

Figure 12. AM Ferrite-rod Antenna
However, an outdoor antenna will provide better reception. Two single wires are required to make an AM outdoor antenna. First, connect one end of a single wire to the AM ANTENNA terminal on the rear panel, and the other end at a very high position outdoors. Next, connect the other single wire between the “G” terminal and an earth ground (such as a water pipe).
(Refer to Figure 11.)

**FM QUADRADIAL OUTPUT JACK**

In anticipation of discrete 4-channel stereo broadcasts, your Model 4300 is equipped with an FM QUADRADIAL OUTPUT jack. The signal available at this jack is the unequalized output of the FM discriminator. Its frequency response characteristics and signal level are ideal to drive any 4-channel adaptor. This jack can also be used as a simple white-noise generator for frequency response check of loudspeakers or amplifiers. For this application, release FM MUTING Switch of the Model 4300 in FM mode and tune off from any FM signal.

**FM DE-EMPHASIS SWITCH**

Selects 75μS or 25μS FM DE-EMPHASIS for accurate reception of Dolbyized FM signals.

**DOLBY FM PRESET LEVEL CONTROLS**

These factory-adjusted controls govern FM output level to the DOLBY circuit. These controls are for the use of a qualified technician only.

**MUTING LEVEL CONTROL**

Adjusts the threshold of the inter-station muting circuit. Turning this control counter-clockwise will lower the threshold to permit reception of weak signals.

**POWER MODE SWITCH**

Switches from 100W x 2 operation to 40W x 4. In the 2-channel mode, only the front speaker terminals are used.

**BE CERTAIN THAT THE UNIT’S POWER SWITCH IS OFF BEFORE OPERATING THE POWER MODE SWITCH.**

**NOTE:** When operating the unit in the 100W x 2 mode, all speaker terminals are “above ground”. Consequently, the use of any switching or testing system which employs a common ground will activate the limiting circuits and should therefore be avoided.

**PRE OUT, MAIN IN JACKS**

For normal operation, these jacks are inter-connected with the supplied jumpers. When connecting an external unit (equalizer, reverberation unit, etc.), remove the jumpers and connect the PRE OUT jacks to the external unit’s inputs. In turn, connect the external unit’s outputs to the MAIN IN jacks.

It is possible to create a higher powered 4-channel system by adding an external amplifier.

If the external amplifier has less than 100 watts x 2, it should be used to drive the rear speakers.

If the external amplifier has more than 100 watts x 2, it should be used to drive the front speakers. In each case, the rear panel POWER MODE Switch should be set to the 100W x 2 position.

**CONNECTING AN EXTERNAL AMPLIFIER FOR REAR CHANNELS**

To use an external amplifier for the rear channels, connect the REAR PRE OUT jacks to the inputs of the external amplifier. In turn, connect the rear speakers to the output terminals on the external amplifier. The 4300 will then supply the power for the front speakers and the external amplifier will supply the power for the rear speakers.

**CONNECTING AN EXTERNAL AMPLIFIER FOR FRONT CHANNELS**

To use an external amplifier for the front channels, connect the REAR PRE OUT jacks to the FRONT MAIN IN jacks. Connect the rear speakers to the FRONT speaker terminals on the 4300. Then, connect the FRONT PRE OUT jacks to the inputs of the external amplifier. In turn, connect the front speakers to the output terminals on the external amplifier. The 4300 will then supply the power for the rear speakers and the external amplifier will supply the power for the front speakers.

**CHASSIS GROUND BINDING POST**

Permits connection of the ground wire from a turntable or other component to reduce hum.

**MAIN AND REMOTE SPEAKERS**

Sixteen quick-connect terminals are provided — eight for main speakers and eight for remote speakers. (Refer to “CONNECTING THE 4300” and “REMOTE SPEAKERS”.)
Terminals work as shown in Figure 13.
1) Press terminal in
2) Insert speaker wire
3) Release terminal

**CONNECTION TO AC OUTLET**

With the front panel POWER pushswitch “OUT” plug the line cord into an electrical outlet supplying the proper voltage.

**CAUTION: DO NOT PLUG YOUR MODEL 4300 INTO A DC OUTLET, AS SERIOUS DAMAGE WILL OCCUR.**

**AC CONVENIENCE OUTLETS**

Two AC outlets, one switched and one unswitched, are provided on the rear panel to supply power to associated components of the system (tape recorder, record player, etc.). The maximum power available from the SWITCHED and UNSWITCHED AC OUTLETS is 100 Watts and 200 Watts, respectively.

**REMOTE CONTROL**

The REMOTE CONTROL connector and switch are intended for use only with the optional Model RC-4 Remote Control. The REMOTE CONTROL Switch assigns control of loudness, balance and volume to the optional RC-4 Remote Control. WHEN THE RC-4 IS NOT USED, THE REMOTE CONTROL SWITCH MUST BE IN THE LOCAL POSITION.

**EXTERNAL DECODER CONNECTION**

A pocket on the bottom of the chassis will accommodate Marantz 4-channel decoders, such as the Model SQA-1. For use, follow the instructions supplied with the optional decoder.

**TAPE RECORDING**

Instructions for connecting a recorder and playing back a tape are given in “SOURCE DEVICES”, page 4.

To record, select the desired program source, using the SELECTOR Switch. Put the recorder connected to the TAPE MONITOR OUT jacks “1 or 2” in the “Record” mode.

For additional information, refer to MODE SWITCH on page 7, and MONITOR SWITCH on page 8.

**POWER CONNECTIONS**

The Model 4300 is designed to operate at 120 Volts AC, 50/60Hz.

**AC PROTECTOR FUSE**

This feature automatically disconnects AC power in the event of a power source or circuit failure. If the POWER pushswitch is activated and the front panel fails to illuminate and no sound is heard through the speakers, unscrew the fuse holder on the rear panel and visually inspect the fuse to see if the internal conducting filament has been broken. If so, replace the fuse with one having the same specifications.
BASIC DOLBY PROCESS

The Dolby system increases the level of low-level, mid- and high-frequency signals during recording and reduces the level of these signals by an identical amount during playback. As a result, the playback signal is identical to the original source signal, but the level of background noise generated by the tape recorder is greatly reduced. A Dolbyized FM broadcast has already been subjected to the first phase of the noise reduction process before it is transmitted. When these signals pass through the Dolby playback circuitry, the mid- and high-frequency noise is greatly reduced.

DOLBY CALIBRATION

The purpose of the following adjustments is to achieve the proper Dolby levels by calibrating the recording and playback signals being applied to the Dolby processors.

The Model 4300 is capable of processing Dolby signals from sources other than a tape recorder (AUX, PHONO, FM, ETC.).

NOTE: It is possible to use the Dolby system for recording and playing back tapes through your system without using a standard alignment tape. Procedures for making your own Dolby Alignment Tape are as follows:
1. Thread a blank tape onto your recorder (or insert a cassette).
2. Set the 400Hz TONE Switch to the "ON" (in) position.
3. Set your recorder's monitor switch to the source position.
4. Set your recorder's record levels to 0 VU.
5. Commence recording. Record about 45 seconds of the tone. This tape you have just made is used to calibrate the Marantz Dolby circuit with the recorder.
6. Switch off the 400Hz TONE.

However, a Dolby recording made on your recorder using the calibrated tape you have just made may not necessarily be compatible with the Dolby circuits in a different recorder or systems. Therefore, for universal compatibility, Marantz offers a standard alignment tape which is available from your local Marantz dealer.

NOTE: The Dolby system can be used with most types of tape recorders. However, it cannot be used with recorders utilizing one set of level control which govern both record and playback levels, or with recorders utilizing an Automatic Level Control (A.L.C.) system.

PROCEDURE FOR PLAYBACK CALIBRATION

1. Turn on the Model 4300 and your recorder.
2. Set the DOLBY function switch on the Model 4300 to the PLAY position.
3. If your recorder has a SOURCE/TAPE (MONITOR) Switch, set it to "TAPE".
4. Load the Dolby standard alignment tape or the calibration tape you have made.
5. Play the Tape.
6. If your recorder does not have output level controls, proceed to step 9.
7. If your recorder has output level controls and the meters on the recorder read playback level, adjust the controls until the meters read "0VU". Then proceed to step 9.
8. If step 7 does not apply to your recorder, set the output level controls to about 2/3 of full output.
9. Adjust the PLAY CAL controls (left and right) on the 4300 to the DOLBY LEVEL reference on the SIGNAL-POWER Level Meter. To adjust the left PLAY CAL control, place the METER Switch to the "OUT" position. To adjust the right PLAY CAL control, place the METER Switch to the "IN" position.
10. You have now properly calibrated the Dolby Playback Level. From this point on, do not change your recorder's output level controls or the Model 4300’s PLAY CAL controls.
Since the calibration is extremely stable and should not have to be repeated (except to periodically check it), we suggest that you mark the settings of your recorder’s output level controls with a felt-tipped pen. Doing so will enable you to easily reset the controls if they are inadvertently moved.

PROCEDURE FOR RECORD CALIBRATION

Before proceeding with the record calibration, be certain that the playback adjustments have been performed. **DO NOT CHANGE THE POSITIONS OF THE RECORDER’S PLAYBACK LEVEL CONTROLS (if any) OR THE 4300’S PLAY CAL CONTROLS.**

When calibrating a recorder that is connected to the TAPE MONITOR 1 IN and OUT Jacks, be sure the SELECTOR Switch is not in the TAPE 1 position. When calibrating a recorder that is connected to the TAPE MONITOR 2 IN and OUT Jacks, be sure the SELECTOR Switch is not in the TAPE 2 position.

For Recorders with Three Heads

1. Thread a blank tape onto your recorder (or insert a cassette).
2. Put the 4300’s DOLBY Switch in the “PLAY” position.
3. Put both the 4300’s and the recorder’s monitor Switches in the “Tape” position.
4. Put the 400Hz TONE Switch in the “ON” (in) position.
5. Commence recording.
6. Adjust the recorder’s record level controls so the tone will deflect the 4300’s SIGNAL-STRENGTH Meter to the “DOLBY LEVEL” mark.
7. Switch off the 400Hz TONE Switch.
8. Dynamic monitoring will be achieved when the 4300’s MONITOR Switch is in the TAPE 1 or TAPE 2.

For Recorders with Two Heads

1. Thread a blank tape onto your recorder (or insert a cassette).
2. Put the 4300’s DOLBY Switch in the “OFF” position.
3. Put the 400Hz TONE Switch in the “ON” (in) position.
5. Adjust the recorder’s record level controls to deflect the recorder’s meters to 0VU.
6. Record the tone for approximately 30 seconds.
7. Stop the recorder and rewind it to the beginning of the tone recording. Switch off the 400 Hz TONE.
8. Put the 4300’s DOLBY Switch in the “PLAY” position.
9. Put the recorder in the play mode and play back the tape.
10. Note the level reading on the 4300’s SIGNAL-STRENGTH Meter. To check the left channel level, put the METER Switch in the “OUT” position. To check the right channel level, put the METER Switch in the “IN” position. The object is to adjust the recorder’s record level controls so the playback level achieved indicates “DOLBY LEVEL” on the 4300’s SIGNAL-STRENGTH Meter.
11. If the Meter indicates “DOLBY LEVEL”, calibration is completed.
12. A) If the Meter indication is above the “DOLBY LEVEL”, repeat steps 2 — 11, but decrease the record level in step 5 to slightly below 0VU on the recorder’s VU Meters.
B) If the Meter indication is below the “DOLBY LEVEL”, repeat steps 2 — 11, but increase the record level in step 5 to slightly above 0VU on the recorder’s VU Meters.

For all Recorders

After the “DOLBY LEVEL” has been achieved on the SIGNAL-STRENGTH Meter, **DO NOT change the recorder’s input or output level controls or the 4300’s PLAY CAL controls.**

Utilizing the recorder’s VU Meters, proper Dolby recording levels are adjustable by using the RECORD LEVEL controls on the front panel of the 4300. This only applies when making a Dolby recording.

**CHANGING THE RECORDER’S RECORD OR PLAYBACK LEVELS OR THE 4300’S PLAY CAL CONTROLS WILL AFFECT THE DOLBY CALIBRATION.**
Mark the calibration positions on the recorder's record and playback level controls to avoid the necessity of re-calibrating after making a non-Dolby recording.

IMPORTANT:
It will be necessary to re-calibrate the Dolby levels when a change in tape speed has been made or when a different brand or type of tape is used.

When the Dolby process is not desired on a recording, record in the normal manner—adjusting the record levels with the recorder's record level controls. DO NOT change the 4300's PLAY CAL controls.

USE OF THE DOLBY SYSTEM ON FM BROADCASTS

Your Model 4300 is equipped to receive Dolby-ized FM broadcasts.
Most FM broadcasts do not currently use the Dolby Noise-Reduction system. To receive FM broadcasts which are not using the DOLBY Noise-Reduction System, leave the DOLBY Switch in the "OFF" position. However, if a local station is broadcasting a Dolbyized FM signal, full advantage of the increase in signal-to-noise ratio may be obtained by putting the DOLBY Switch in the "DOLBY FM" position. The rear panel DOLBY FM PRESET LEVEL controls are factory-adjusted. Do not change the position of these controls.

FM DE-EMPHASIS SWITCH

This rear panel switch operates only when the front panel DOLBY Switch is in the "DOLBY FM" position. It alters the frequency response of the FM signal. Normally, this switch should be left in the 75µS position. However, if the station is broadcasting the Dolbyized signal using a 25µS pre-emphasis, put this switch in the "25µS" position to obtain flat FM frequency response. If in doubt, call the station.

EXPLANATION OF THE DOLBY MODE CHART

This chart indicates the correct DOLBY Switch positions for various types of input material. The input format is indicated in the left column and the appropriate DOLBY Switch position, together with FM DE-EMPHASIS Switch position, is shown under the appropriate mode of operation.

<table>
<thead>
<tr>
<th>Operating Mode Input</th>

For initial calibration, utilizing the Dolby standard alignment tape, see detailed instructions on Pages 14 thru 16 of this manual.

Table 1. Dolby Mode Chart
TECHNICAL DESCRIPTION

GENERAL

Figure 14 is a block diagram of the model 4300 Stereo 2 + Quadrail 4 Receiver showing main functional elements and input and output signal routing. PHONO INPUT jacks are provided for the front pair of channels.

FUNCTIONAL DESCRIPTION

FRONT END

FM antenna signals are applied through a balun transformer to the antenna coil which drives a field-effect transistor RF amplifier. The signals from the RF amplifier are fed through the double-tuned RF tank circuit to the FET Mixer stage, which is also fed by the signal generated by a local oscillator. Careful attention to its thermal and electrical characteristics has minimized drift, thus obviating the necessity for AFC. The 10.7 MHz converted signal is then fed to a phase-linear ceramic IF filter, followed by the limiter. The output of the FM discriminator is fed to a buffer amplifier which then drives the demodulator.

IF STAGES

The IF section consists of six transistors and three stages of dual element ceramic filters. The characteristics of these filters are ideal in that the 200KHz passband is phase-linear, with sharp cutoff slopes. This exceptional phase linearity assures the elimination of a major source of high-frequency distortion and a loss of stereo separation. The sharp cutoff slopes provide improved selectivity, permitting reception of closely spaced channels.

LIMITER

The Model 4300 utilizes symmetrical diode limiter circuits consisting of high-performance Gold Bond Hot Carrier type diodes and IF limiter amplifier with a very small dynamic symmetrical aperture, eliminating the need for an AGC circuit which introduces low frequency distortion. Undesirable amplitude modulation (AM signals, AM noise, AM distortion) are removed from the IF signal within the limiter.

FM STEREO DEMODULATOR

The stereo composite signal obtained from the buffer amplifier is first led to the FET muting circuit; then to the phase locked loop stereo demodulator IC circuit and decoded into both left and right channel signals. Each left and right channel signal is then applied to the 18KHz low pass filter (LPF) and de-emphasis networks to remove the undesired switching carrier signal in the audio signals. Next, each audio signal is applied to the audio amplifier consisting of NPN-PNP direct-coupled transistors and amplified to the required signal level of about 775mV RMS. Finally, each amplified signal is led to the SELECTOR Switch.

The multiplex stereo demodulator circuit consists of a phase locked loop IC and is equipped with a separate automatic Stereo/Monaural switching circuit. The circuit checks the input signal intensity and actuates the stereo demodulator and stereo indicator lamp automatically, when the input signal is of sufficient strength to provide high quality stereo reception. When the input signal intensity is insufficient for this purpose, the stereo signal is automatically changed to a monaural signal to insure reception with a high quality signal-to-noise ratio.

MUTING CIRCUIT

In the absence of an FM carrier, all FM receivers produce inherent noise. The muting circuit eliminates this noise, providing noise-free tuning from station to station.

A muting circuit, consisting of a two-transistor noise amplifier and a three-transistor (including FET) switching circuit, has been incorporated in the Model 4300. The muting circuit perfectly mutes out all the inter-station noise and also completely mutes out the side slope spurious response of the unit. The circuit has been designed to minimize annoying "pop" noise for velvet smooth tune-in and tune-out.

AM TUNER

The AM TUNER portion of the 4300 is composed of one IC circuit (including RF amplifier, local oscillator, mixer, IF amplifier, detector and a signal strength indication amplifier) and one transistor amplifier to amplify the detected audio signals. A three-section variable capacitor improves spurious response ratio.

The ceramic filter utilized in the AM IF amplifier comes with high selectivity and wide bandwidth for interference-free hi-fi reception.
Following the AM IF amplifier, the AM detector recovers the audio modulation and provides this signal to the SELECTOR Switch.

The AM tuner and IF amplifier incorporates an automatic gain control circuit which maintains a constant level of all stations in the AM band.

An advanced AM tuner integrated circuit has been utilized for the AM tuner portion of the Model 4300.

PHONO AMPLIFIERS

These amplifiers permit phono signals of up to 100 millivolts to be handled without overloading. The RIAA equalization network provides precise equalization and sets the phono preamplifier voltage gain to 40 dB (at 1,000Hz).

SELECTOR SWITCH

The SELECTOR Switch selects the program source for listening or recording. The Model 4300 has four sets on input jacks: PHONO, CD-4/AUX, TAPE MONITOR 1 and TAPE MONITOR 2. Any discrete 4-channel program source can be connected to the CD-4/AUX jacks. The input sensitivity for each set of input jacks is 1.8 millivolts at PHONO, and 180 millivolts at CD-4/AUX, TAPE MONITOR 1 and TAPE MONITOR 2. The SELECTOR Switch outputs are fed through the DOLBY Switch and TAPE MONITOR OUT jacks to the MODE Switch.

MONITOR SWITCH

When the MONITOR Switch is in the SOURCE position, the SELECTOR Switch outputs are fed through the DOLBY Switch to the MODE Switch.

When the MONITOR Switch is in TAPE 1 or TAPE 2 positions, the input signals from the TAPE MONITOR (1 or 2) jacks are fed to the DOLBY Switch.

TONE CONTROL

After volume level control, each channel program source is fed into the tone control network. The network uses two-stage, direct-coupled NPN and PNP configuration at the input stage for the high-impedance termination of the volume control output, and low driving impedance to the R-C feedback type tone control network. In the tone control network, each signal adjusted for bass and treble is amplified in two-stage, direct-coupled NPN and PNP configuration and is delivered through a HIGH FILTER Switch to the main amplifier section. The driving impedance to the balance high filter section is satisfactorily reduced by NFB.

POWER AMPLIFIER

Your power amplifiers are incorporated for driving left-front, left-rear, right-front and right-rear speakers. Each of these amplifiers includes preamplifier, driver, electronic protective and output circuits. These amplifiers consists of four totally direct-coupled and differential amplifiers to provide superior dynamic characteristics, frequency response and satisfactory D.C. stability. The output stages employ eight high current, high voltage, silicon output transistors, having superior linearity and sufficient collector dissipation margin, arranged in a quasi-complimentary Darlington format.

DRIVER STAGE

This stage incorporates a pair of push-pull, complimentary-symmetry transistors (PNP, NPN). The electronic protective circuit comprised of three transistors and four diodes for each channel, senses the peak output current and limits the current to the driver transistors at a safe, predetermined value. This limiting current protects the driver and output transistors under over-drive and short circuit conditions and effectively prevents the driver and output transistors from exceeding safe operating conditions.

GENERAL REQUIREMENTS

Power Requirements ....... 120V AC 50 to 60Hz
Power Consumption
— at rated power output, all channels ....... 650W
— idling (no signal) ................. 60W
Dimensions — Panel Width ....... 19-19/64 inches
— Panel Height ....... 5-3/4 inches
— Depth .............. 15-3/16 inches
Weight — Unit alone .............. 51.6 lbs
— Packed for shipment ........ 62.7 lbs
INSTALLATION OF WALNUT CABINET

The optional walnut cabinet may be installed in the following manner.
If you have an optional plug-in decoder, un-plug it from the chassis. If you do not have an optional plug-in decoder, remove the cover plate from the bottom of the chassis by removing the four screws. Place the rear end of the Marantz unit into the front end of the walnut cabinet and slide it into place.
Using the four screws supplied with the walnut cabinet, pass each screw through each of the supplied rubber feet and screw them into the holes provided.
If you have an optional plug-in decoder, install it at this time by plugging it into the Marantz unit, passing it through the walnut cabinet's cutout.
If you do not have an optional plug-in decoder, replace the metal plate in the same manner and tighten with screws.

SERVICE NOTES

REPAIRS

Only the most competent and qualified service technicians should be allowed to service the Marantz Model 4300 Stereo 2 + Quadradial 4 Receiver. The Marantz Company and its warranty station personnel have the knowledge and special equipment needed for the repair and calibration of this precision instrument.
In the event of difficulty, write directly to the factory (to the attention of the Technical Service Department) for the name and address of the nearest Marantz warranty or authorized service station. Please include the model and serial number of the unit together with a description of the problem.
If it should ever be necessary to ship the unit to the factory or authorized service station and your Receiver is mounted in its accessory walnut cabinet, ALWAYS REMOVE THE CABINET BEFORE PACKING. DO NOT SHIP THE ACCESSORY WALNUT CABINET. Pack the unit carefully, using the original packing material. If the packing material has been discarded, lost or damaged, write to the factory (to the attention of the Technical Service Department) for new packing material. Carton, fillers and packing instructions will be returned to you at a nominal charge.

No Receiver should be returned to the factory without an Authorized Return Label, which the Marantz Company will supply if the description of difficulties appears to warrant factory service. Please Pack the Receiver as illustrated in Figure 15.

CAUTION

Please DO NOT ship your Receiver mounted in its accessory walnut cabinet.

Insure the Receiver for full value:

Make sure that your correct return address is on the shipping label.

Ship via a reputable carrier (DO NOT USE PARCEL POST). Be sure to obtain receipt from the carrier.

Figure 15. Packing Instructions
